                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                complement activation" proteins or truncated, hybrid or recombinant forms of them. CR1-4 is a preferred truncated form and a number of specified substitution variants of it are claimed in which certain positions in SCR-2 which have been identified as important for the degree of C3b- and C4b-binding are substituted by amino macids from the corresponding positions in SCR-9. The specification does not contain the CR1-4 sequence; the sequence given here was constructed from the full-length CR1 amino acid sequence having GENESEQ accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The cDNA clone designated CR1-4 was described in J.Exp.Med.(1988) 168:1255-1270. It encodes the first 8 and a half amino terminal SCRs of CR1. The invention concerns analogues of "regulator of complement activation" proteins or truncated, hybrid or recombinant forms of them. CR1-4 is a preferred truncated form and a number of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specified substitution variants of it are claimed in which certain positions in SCR-2 which have been identified as important for the degree of C3b- and C4b-binding are substituted by amino acids from the corresponding positions in SCR-9. The specification does not contain the CRI-4 sequence; the sequence given here was constructed from the full-length CRI amino acid sequence having GENESEO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

It encodes the first 8 and a half amino terminal SCRs of CR1. The invention concerns analogues of "regulator of complement activation" proteins or truncated, hybrid or recombinant forms of them. CR1-4 is a preferred truncated form and a number of specified substitution variants of it are claimed in which certain positions in SCR-2 which have been identified as important for the degree of C3b- and C4b-binding are substituted by amino acids from the corresponding positions in SCR-9. The specification does not contain the CR1-4 sequence; the sequence given here was constructed from the full-length CR1 amino acid sequence having GENESEO accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 11; Fig 2 and R11810; 23pp; English

Claim 12; Fig 2 and R11810 and descriptions in J.Exp.Med.(1988)

Claim 12; Fig 2 and R11810 and descriptions in J.Exp.Med.(1988)

Claim 12; Fig 2 and R11810 and descriptions in J.Exp.Med.(1988)

Claim 13; Fig 2 and R11810 and descriptions in Later Claimed in which certain positions in SCR-2 which have been identified as important for the degree of C3b- and C4b-binding are substituted by amino acids from the corresponding positions in SCR-9. The specification does not contain the CR1-4 sequence; the sequence given here was constructed accession number R11810 and descriptions in the disclosure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

19-MAR-1993 (first entry)
CR1-4 (78T, 79D) analogue.
short consensus repeat; regulator of complement activation;
C3b binding; C4b binding; human complement type 1 receptor.

7 claim 11; Fig 2 and R11810; 23pp; English.

7 The CDNA clone designated CR1-4 was described in J.Exp.Med.(1988)

7 close 1255-1270. It encodes the first 8 and a half amino terminal

8 close of CR1. The invention concerns analogues of "regulator of

9 complement activation" proteins or truncated, hybrid or recombinant

9 complement of them. CR1-4 is a preferred truncated form and a number of

9 complement of them. CR1-4 is a preferred truncated form and a number of

9 complement activation variants of it are claimed in which certain

9 complement of SCR-9 which have been identified as important for the

9 contain the CR1-4 sequence; the specification does not

9 contain the CR1-4 sequence the sequence have was constructed

9 contain the CR1-4 sequence; the sequence have was constructed

9 contain the CR1-4 sequence for a here was constructed

9 concession number R11810 and descriptions in the disclosure.

pir62 (1:pir2 2:pir2 3:pir3 4:pir4

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 43.995; Variance 69.824; scale 0.630

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A61565
                                                                                                                                                                                                                Weiss, E.H.
J. Immunol. (1991) 146:3190-3196
Cloning of the 1.4-kb mRNA species of human complement factor
H reveals a novel member of the short consensus repeat
family related to the carboxy terminal of the classical
150-kDa molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Campbell, I.D.

NT Two codominant alleles of factor H are present in mice.
NT Factor H functions as a cofactor in the inactivation of C3b by serine proteinase I and also increases the rate of dissociation of the C3bBb complex (C3 convertase) and the (C3b)nBb complex (C5 convertase) and the (C3b)nBb complex (C5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ##status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    convertase) in the alternative complement pathway.

Blochem. J. (1994) 301:391-397
Cloning and characterization of a cDNA representing a
putative complement regulatory plasma protein from barred
sand bass (Parablax neblifer).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S77894

It binds as a cofactor to C3b/C4b inactivation (C3bINA), which then hydrolytes the complement fragment C4b. It also accelerates the degradation of the C4bC2a complex (C3 convertase) by dissociating the complement fragment C2a.
                                                                                                                                                                                                                                   IPICEVVKCLPVTAPENGKIVSSAMEPDREYHFGQAVRFVCNSGYKIEGDEEMHCS--DD 177

Tabular output not generated.

Description: Perfect Score:

Sequence: >US-09-316-163-11 (1-329) from US09316163.pep 2539 1 EDCNELPPRRNTEILTGSWS.......PDIKHGGLYHENMRRPYFPV 329

Scoring table: PAM 150 Gap 11

Post-processing: Min.Mnum Match 0% Lifting first 45 summaries Searched: 83857 spqs; 30454973 residues

Database: wiss-prot38 1:swissprot

Mean 44.764; Variance 62.937; scale 0.711

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

J. Mol. Biol. 232:268-284 (1993).

-: FUNCTION: FACTOR H FUNCTIONS AS A COFACTOR IN THE INACTIVATION C3B BY FACTOR I AND ALSO INCREASES THE RATE OF DISSOCIATION OF C3BBB COMPLEX (C3 CONVERTASE) AND THE (C3B)NBB COMPLEX (C5 CONVERTASE) AND THE (C3B)NBB COMPLEX (C5 CONVERTASE) IN THE ALTERNATIVE COMPLEMENT PATHWAY.

-: SIMILARITY: CONTAINS 20 SUSHI (SCR) REPEATS.
-: CAUTION: REF.2 SEQUENCE DIFFERS FROM THAT SHOWN FROM POSITION 341 ONWARD DUE TO A FRAMESHIFT.

                                                                                                                                                                                                                                                                                                                                                             FUNCTION: C4BP CONTROLS THE CLASSICAL PATHWAY OF COMPLEMENT ACTIVATION. IT BINDS AS A COFACTOR TO C3B/C4B INACTIVATOR (C3BINA), WHICH THEN HYDROLYZES THE COMPLEMENT FRAGMENT C4B. IT ALSO ACCELERATES THE DEGRADATION OF THE C4BC2A COMPLEX (C3 CONVERTASE) BY DISSOCIATING THE COMPLEMENT FRAGMENT C2A. ALPHA CHAIN BINDS C4B. IT INTERACTS ALSO WITH ANTICOAGULANT PROTEIN S SUBUNIT: DISSUFIDE-LINKED COMPLEX OF C4BP ALPHA AND BETA CHAINS. SIMILARITY: TO C4BP BETA CHAIN AND TO PIG APOLIPOPROTEIN R. SIMILARITY: CONTAINS 8 SUSHI (SCR) REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S-RVCQPPPDVLHAERTQRDKDNFSPGQEVFYSCEPG-Y-DLRGAASMRCTPQGDWSPAA 350
